Exemplar: GPK Scorecard, Team Klausurly (M07)

Updated: 2026-10-19.

Synthetic exemplar, realistic but invented. Scored with the GPK Decision Framework. Every score cites its artifact. 0 = no evidence or the evidence says no, 1 = weak or mixed, 2 = strong evidence a stranger could check.

Team: Klausurly, AI exam prep from professors' old exams (B2C, students). Context: prototype live 2 weeks, 41 student users.

Step 1, Kill Criteria Log. No line crossed before today. The Module 04 line ("fewer than 10% of segment visitors sign up") held at 13.4%. The monkey test's line is written below, before the first ask.

PROBLEM (max 6) 1. Do people in one named segment describe the problem unprompted? **2.** 14 interviews with 3rd-semester engineering students, exam-panic quotes raised before any prompt (Interview Log). 2. Do they spend time or money on a workaround today? **1.** Time yes, past exams hunted in forums. Money almost none, 2 of 14 ever paid for prep (€12, €19 one-time). 3. Does the problem occur at least weekly? **1.** Weekly only in exam season (Pain Map).

SOLUTION (max 6) 4. Did people from the segment use the prototype without help? **2.** 41 users, D7 usage 38% in exam week (Use Log). 5. Is it 10 times better, with proof? **1.** Better than forum-hunting, heard from 3 users ("this saved my Statik exam"). ChatGPT with a good prompt gets most of the way for free. 6. Possible now, not two years ago? **1.** Language models generate exam-style questions. Named, not sourced, and free tools have the same capability.

TRACTION (max 6) 7. Has anyone paid? **0.** Nobody asked yet. 8. Do users come back without being pushed? **2.** Repeat use in exam week, dated in the Use Log. 9. Is a metric growing week over week? **1.** Users grew in one week, then flat after the exam.

TOTAL: 11/18, Pivot zone (9 to 13). Weakest section: traction. Problem real, wallet untested.

The monkey and its line (logged before the first ask). Monkey: "Students pay €4.99 per exam." Line: "If fewer than 3 of the first 10 users we ask pay €4.99, the monkey is false and the Pivot becomes a test of the B2B ask (tutoring schools), with its own line."

Why this scores well: question 7 is scored zero by the team's own hand, and the team tests that zero this week instead of arguing it away. That is the discipline being graded.
