Exemplar: GPK Scorecard — Team Klausurly (M07)

Synthetic exemplar — realistic but invented. Scored on artifacts, each answer cites its evidence. 0 = no evidence · 1 = weak/mixed · 2 = strong.

Team: Klausurly — AI exam-prep from professors' old exams (B2C, students). Verdict context: prototype live 2 weeks, 41 student users.

PROBLEM (max 6) 1. Real, frequent pain in a named segment? **2** — 14 interviews, exam-panic quotes, segment = 3rd-semester engineering students. 2. Do they spend money/time on alternatives today? **1** — time yes (past exams hunted in forums); money almost none: two of 14 ever paid for prep (€12, €19 one-time). 3. Budget authority in segment? **1** — students self-pay but tiny wallets; parents untested.

SOLUTION (max 6) 4. Does the prototype deliver the JTBD? **2** — 41 users, D7 usage 38% in exam week; "this saved my Statik exam" (verbatim, n=3). 5. 10x on the bleeding dimension? **1** — better than forum-hunting; ChatGPT-with-a-good-prompt gets 70% of the way free. 6. Would they PAY? **0** — pricing test ran (M09 preview, €4.99/exam): 41 users, 9 asked live, 0 paid. Threshold was "≥3 of first 10 asks" — missed.

WIN (max 6) 7. Distribution we can reach repeatedly? **2** — Fachschaft channels convert absurdly well (12.9% CTR). 8. Defensible vs status quo in 12 months? **0** — professors upload exams to Moodle increasingly; LLMs commoditize the core. 9. Team-problem fit? **1** — they're students (access ✓) but nobody has an exam-content edge.

TOTAL: 10/18 → PIVOT ZONE (9–13).

Pre-committed kill line for the week (announced at tribunal): "If the B2B pivot ask (tutoring schools paying for the question engine) gets 0 interested replies from 10 named schools by Friday, we KILL and take the Restart Ramp."

Why this scores well: question 6 is scored ZERO by the team's own hand — against their own hopes, on their own threshold. That's the discipline being graded.
