Exemplar: Landing-Page Test — Team TurbineTrack (M04)

Synthetic exemplar — realistic but invented. Note the order: threshold FIRST, then traffic, then an honest read-out against the committed number.

Hypothesis: Owner-led turbine-service SMEs will show buying interest in same-day reporting ("Report done when the harness comes off").

Pre-committed threshold (Kill Criteria Log, 21.03, BEFORE launch):

> "≥8% of target-segment visitors leave a work email on the demo-request form, OR we pivot the promise (not the segment — segment evidence is strong)."

The page: headline = Markus's quote: "Never match photos to turbine IDs on a Friday again." One CTA ("Get the 3-minute demo"). Impressum + privacy line. Plausible analytics, UTM on every link.

Traffic (week of 24.03) — UTM source report:

Source	Visitors	Target-segment?	Signups	Conv.
LinkedIn posts in 2 wind-industry groups	61	yes	7	11.5%
Direct outreach links (30 emails to service SMEs)	24	yes	4	16.7%
€50 Google Ads ("Windkraft Wartung Software")	87	mixed	2	2.3%
Friends/uni (excluded per rubric)	33	**no — excluded**	5	—

Read-out vs threshold: Target-segment only: 85 visitors, 11 signups = **12.9% ≥ 8% → PASS.** (Reported both numbers in check-in: 6.4% blended, 12.9% target-segment — and said out loud which one the threshold was written on.)

What we changed anyway: ads keyword traffic converted at 2.3% — wrong intent (operators searching SAP plugins). Killed the ad set, doubled outreach. **Decision:** GO to M05 with the same-day-report promise; the 11 signups became the M08 outreach list's core.

Why this scores well: the threshold predates the data and is quoted verbatim; friends are excluded without being asked; the blended-vs-target distinction is volunteered, not extracted.
