Workshop 09: Revenue Sprint

Updated: 2026-10-20.

MODULE 09 · FROM PROTOTYPE TO PRODUCT · WORKSHOP · GOALS M09-LG1 TO LG4

Step 1 places your test price.

Step 2 builds this, in test mode.

By the start of Module 10, your team sells one offer at a price you tested, customers pay for it inside your live product without a founder in the sale, and the same offer sells again without custom work. Today you price it, build it and send people to it. Examples are made up, a tool nudging recruiters about quiet finalists.

Bring. Laptops, your repository and coding agent, your Module 08 records, and a team payment account. Live mode may need your trade registration.

The 90 minutes

Time	Step	You leave with
20′	1 · Price it	A unit, a test price, a dated line
50′	2 · Build the checkout	A test payment in your deployed product
20′	3 · Go live, then commit	A live ask, first people sent, targets

Step 1 · Price it (20′)

Goal. One price to test.

1. **Name the unit (4′)** that grows with their value. Seat, use, outcome or once.
2. **Price from value (6′),** what the problem costs them and what they pay today. Cost is only the floor.
3. **Pick the price to test (5′)** from your Module 08 price. Survey answers can pick it, only payments test it.
4. **Log your line (5′)** in the Kill Criteria Log with your midweek date, before anyone sees the price. A kill line is a result you count, a date, and what you do if you cross it, written down before the data comes in. Or adopt the homework's.

Good	Weak
"Per recruiter seat. A lost finalist costs a placement. We test €99 a month."	"Our AI costs €3, so €9 is fair."

Output. A unit, a test price, a dated line.

Step 2 · Build the checkout (50′)

Goal. A test payment lands in your product's records.

1. **Count the steps from yes to paid (5′),** then cut some.
2. **Brief your coding agent (5′),** ask and webhook, in small steps.
3. **Build in test mode (30′).** A hosted checkout, then a webhook that checks the signature and records each payment once. Stripe's test card is 4242 4242 4242 4242.
   - Watch out. Secret keys live on the server. Never in the code, the chat or a public variable.
   - Watch out. Builder takes payments? Keep it till it stops you.
   - Selling B2B? An order form that issues the numbered invoice counts.
4. **Deploy from your repository (10′).** Pay again there, still in test mode.

Good	Weak
"Go Pro" sits where the nudge goes out, three clicks to paid.	A link in the email footer.

Output. A test payment recorded in your deployed product.

Step 3 · Go live, then commit (20′)

Goal. Real people see your price.

1. **Check the plumbing (4′).** Money lands on the team's account. Invoices carry a number and, under €25,000, the § 19 line (Legal Basics).

2. **Switch to live (4′).** Not verified yet? Invoice meanwhile.
3. **Send the first people (7′)** to the product, Module 08's "not now" first.
4. **Commit to the bar (5′).** "Run your price test, let customers pay inside your live product without a founder in the sale, and reach €1,000 cumulative revenue from outside your social graph, with the same offer bought by more than one customer. The learning floor is €500 cumulative, with at least one payment made inside your product." Each founder names a count. Set your midweek euros.

Good	Weak
Line logged 10:31, live 11:40, nine sent.	"We'll go live once the pricing page looks nicer."

Output. A live ask, first people sent, targets.

Arrived empty-handed?

- **No price?** Price your concierge offer, build a page that charges for it.
- **No contacts?** Send it to your interviewees and your segment's groups.
- **No repository or account?** Builder payments and a sandbox.

Bring and use

The Objection Log exemplar (made up) and the Student Toolkit. The lecture is background.
